METHOD TO TRANSFER INFORMATION BETWEEN DATA STORAGE DEVICES

Abstract Of The Disclosure

A method to transfer information between data storage devices. The method

5   provides an information storage assembly comprising a frame, a memory device disposed

on that frame, information written to that memory device, a power supply removeably

attached to the frame, and a first data storage device comprising a first identity

removeably attached the frame. The method writes first configuration information to the

memory device. If the method detects an error in the first data storage device, then the

10   method removes the first data storage device from the frame. The method further

provides a replacement data storage device, removeably attaches that replacement data

storage device to the frame, and determines if the replacement device uses the first

configuration information. If the replacement device uses the first configuration

information, then the method provides the first configuration information to the

15   replacement data storage device from the memory device.
